Abstracts

Mbb Bio - Chip Media refers to the bio - carriers in the Moving Bed Biofilm Reactor (MBBR) system, which are usually made of plastic materials such as polyethylene. It serves as a substrate for microorganisms to attach and grow, and is a key component for the efficient operation of MBBR systems. It generally has a high - specific - surface - area structure, which can provide a large attachment surface for microorganisms. For example, some bio - chip media have a specific surface area of more than 5500 m²/m³. Its shape is diverse, such as cylindrical, spherical, etc. Some are internally cross - supported and externally finned. This structure is beneficial for increasing the contact area between the biofilm and wastewater, and improving the efficiency of pollutant removal. Working principle: Microorganisms attach to the surface and inside of the bio - chip media to form a biofilm. When the wastewater flows through the reactor, the organic matter, nitrogen, phosphorus and other pollutants in the water are absorbed and metabolized by the microorganisms in the biofilm, so as to achieve the purpose of purifying the wastewater. In the aerobic process, the aeration at the bottom of the reactor makes the bio - chip media move continuously in the water, which not only ensures the contact between the biofilm and the wastewater, but also provides oxygen for the degradation of pollutants. In the anoxic and anaerobic processes, mechanical mixers are used to make the carriers move.

The global Mbb Bio-Chip Media market size was estimated at USD 1592.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.40% during the forecast period.
