Abstracts

Mbbr Biomedia (Moving - Bed Biofilm Reactor Biomedia) and biochips are both important concepts in the field of biotechnology, but they have different characteristics and applications. Mbbr Biomedia is a kind of microbial carrier applied in the MBBR process, mainly providing a suitable growth environment for microorganisms. Usually made of polyethylene, polypropylene and their modified materials, polyurethane foam, etc., its density is close to that of water, and it is mostly cylindrical or spherical. In the aeration tank, it moves freely with the water flow, and the microorganisms grow on its surface to form a bio - film. The collision and shearing action of the carrier in the water make the air bubbles smaller, increasing the utilization rate of oxygen. Moreover, the interior and exterior of each carrier have different types of microorganisms. The interior is anaerobic or anoxic bacteria, and the exterior is aerobic bacteria, which can realize the simultaneous occurrence of nitrification and denitrification reactions. IMbbr Biomedia has the advantages of large specific surface area, good hydrophilicity, high biological activity, fast bio - film formation, etc. It can increase the biomass and types of microorganisms in the reactor, thereby improving the treatment efficiency of the reactor. It is not easy to agglomerate or block, and the bio - film can fall off automatically, without the need for regular back - flushing, and has strong shock - load resistance. Widely used in sewage treatment, it can efficiently remove biological oxygen demand (BOD), chemical oxygen demand (COD), total nitrogen, phosphorus and other pollutants, and is also applicable to pond filters, aquaculture and other fields.In molecular biology, Biochip is an engineered substrate, also known as a "miniaturized laboratory", which can carry out a large number of biochemical reactions simultaneously. It uses the principle of molecular hybridization, immobilizes a large number of known biological molecules (such as DNA probes, antibodies, etc.) on the chip surface, and makes them hybridize with the labeled sample molecules. Then, it analyzes the biological information of the sample by detecting the hybridization signal. Common biochips include gene chips,

protein chips, cell chips, etc. It has the characteristics of high - throughput, miniaturization, and automation, which can realize the rapid and efficient detection and analysis of a large number of biological samples, and has the advantages of high sensitivity and strong specificity. Its application fields are wide, including disease diagnosis, genetic testing, drug screening, biological research, etc. For example, in disease diagnosis, it can quickly detect the presence of specific genes or proteins, helping doctors make a diagnosis.

The global Mbbr Biomedia and Biochip market size was estimated at USD 12074.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.20% during the forecast period.
