## Abstracts

The MBBR System is an advanced wastewater treatment technology utilizing suspended plastic carriers (typically polyethylene/polypropylene with 500-800m<sup>2</sup>/m<sup>3</sup> specific surface area) to support microbial biofilm growth. Combining advantages of activated sludge and biofilm processes, it delivers high treatment efficiency (>90% BOD removal), strong shock load resistance (handling 2-3x flow variations), and compact footprint (30-50% space savings vs conventional systems). Ideal for municipal sewage and industrial wastewater (e.g., food processing, pharmaceutical), it reduces energy consumption by 20-40% while enabling plant upgrades without expansion. Driven by stringent global discharge standards, the MBBR market exhibits: 1) Carrier innovations (nano-coated for enhanced mass transfer); 2) Smart controls (AI-optimized aeration); 3) Modularization (containerized units). While replacing conventional activated sludge in municipal applications, it competes with MBR in industrial wastewater. Future may focus on enhanced nutrient removal, toxic-resistant carriers, and low-carbon operation (solar-powered), though carrier fouling in high-load wastewater and capital costs remain challenges.

The global MBBR System market size was estimated at USD 1884.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.20% during the forecast period.
