Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on MBE Systems competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The Molecular Beam Epitaxy (MBE) system is termed as an ultra-high vacuum technique for the layer-by-layer (epitaxial) deposition of thin films. The technique is exclusively used for the development of very high purity III-V semiconductors where the thickness of layers can be measured with sub-monolayer accuracy. The system contains six solid source effusion cells and 2 RF plasma gas sources. It is exclusively used in the manufacture of semiconductor devices like transistors, and known as a fundamental tool for the development of the nanotechnologies. Moreover, it is a valuable system in the development of urbane optoelectronic and electronic devices and MBE growth of semiconductor layers are essential for resonant-cavity photodetectors. Europe is the world's largest production region of MBE systems, and exports to many countries around the world. With the development of the semiconductor and materials industry, customers have put forward more quality requirements and higher technical indicators for the molecular beam epitaxy system as their key research and production equipment, and the specifications have become more and more diversified. Enterprises of MBE systems should actively improve product quality so that their products have market appeal. The major manufacturers of MBE systems on the market include Veeco in the United States, Riber in France and DCA in Finland. There are many manufacturers of normal molecular beam epitaxy products, such as Veeco, Riber and Sienta Omicron. Manufacturers of laser MBE systems mainly include Pascal in Japan and Prevac in Poland. At present, the normal molecular beam epitaxy system occupies the main sales market, with a market share of about 74%. The laser molecular beam epitaxy system is also widely used because it is suitable for growing thin films with multiple elements, high

melting points, and complex layered structures. In recent years, Chinese molecular beam epitaxy (MBE) companies have sprung up like mushrooms after rain, mainly due to the country's high attention and strong support for high-end semiconductor manufacturing, quantum technology, new materials research and development and other fields. Behind this phenomenon is China's rapid catch-up and independence process in the field of key core technologies. In recent years, more and more Chinese companies (such as CETC48, SKY, etc.) have entered the field of MBE equipment manufacturing, gradually narrowing the technological gap with international giants. Through independent research and development and international cooperation, Chinese companies have made a series of breakthroughs in ultra-high vacuum technology, precision control systems and high-purity material sources, improving the performance and reliability of equipment.

The global MBE Systems market size was estimated at USD 106.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.00% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global MBE Systems market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
