Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on MCS (Mono-Chlorosilane) for Semiconductor competitive dynamics, regional economic interdependencies, and supply chain reconfigurations.MCS (Mono-Chlorosilane) is a key chlorine-containing silicon compound in semiconductor manufacturing. It is mainly used as a precursor for preparing high-purity silicon materials, reducing them to generate polycrystalline silicon and single-crystalline silicon, which are used in the production of wafer substrates for integrated circuits, memory chips, etc. It is also used as a raw material for synthesizing trimethylsilylamine (TSA), supporting the atomic layer deposition (ALD) process in advanced processes (such as below 5nm), and depositing high dielectric constant films and gate structures.Monochlorosilane for semiconductors is a key chemical precursor, mainly used to manufacture high-purity silicon materials. It converts monochlorosilane into polysilicon and single crystal silicon through chemical vapor deposition (CVD) or similar processes, thereby providing basic wafer materials for the production of integrated circuits, memory and other semiconductor devices. In addition, monochlorosilane can also be used to generate other advanced silicon compounds such as trisilylamine (TSA), which are essential for depositing high-quality insulating layers and other thin films in advanced processes such as atomic layer deposition (ALD). Their purity requirements are extremely high to ensure the performance and reliability of semiconductor devices.

The global MCS (Mono-Chlorosilane) for Semiconductor market size was estimated at USD 82.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.10% during the forecast period.
