Abstracts

MEA hot presses are critical equipment specifically designed for the fabrication of fuel cell Membrane Electrode Assemblies (MEA), which bond the catalytic layer, proton exchange membrane, and gas diffusion layer of the MEA together through precisely controlled temperature and pressure. This process ensures optimal interfacial contact and structural stability between layers, thereby enhancing the efficiency of electron and ion transfer. The hot pressing technique optimizes the microstructure within the membrane electrode, significantly improving the overall performance and long-term reliability of the fuel cell. The automated control system of the hot presses guarantees high consistency and precision in the production process, contributing to the quality improvement of MEA while also meeting the demands of large-scale production and reducing manufacturing costs.

The global MEA Hot Presses market size was estimated at USD 170.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.70% during the forecast period.
