Report Overview

Mealworms feed refers to the use of mealworms?primarily the larvae of the darkling beetle (*Tenebrio molitor*)?as a protein-rich dietary supplement for livestock, poultry, aquaculture, and pets. This feed type is gaining traction due to its high nutritional value, containing up to 50-60% protein, essential amino acids, healthy fats, and micronutrients like phosphorus and potassium. It is particularly favored in sustainable agriculture as mealworms can be reared on organic waste streams, reducing environmental impact compared to conventional feed sources like soybean meal or fishmeal. The market is driven by increasing demand for alternative protein sources, rising concerns over livestock feed sustainability, and regulatory approvals in regions like the EU, where dried mealworms are authorized for use in aquaculture and poultry feed. However, challenges include scaling production cost-effectively, consumer acceptance, and competition from other insect-based feeds like black soldier fly larvae. Growth is further supported by advancements in automated farming techniques and investments in insect protein startups.

The global Meal Worms Feed market size was estimated at USD 100.11 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
