Abstracts

Robotics is the field where Mecanum wheels are most widely applied. The Mecanum wheel is an omnidirectional wheel consisting of a hub and several rollers installed around it at a certain angle of inclination. The axes of these rollers typically form a 45-degree angle with the axis of the hub. Mecanum wheels for robots are primarily used in Automated Guided Vehicles (AGVs), Autonomous Mobile Robots (AMRs), and other similar devices. Controlled by servo motors and combined with various navigation technologies such as laser navigation and visual navigation, these wheels enable the vehicles to move in any direction within a plane, including forward, backward, laterally, diagonally, and in-place spinning. This allows the robots to autonomously complete tasks such as picking up and transporting goods.

The global Mecanum Wheels for Robots market size was estimated at USD 89.2 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.60% during the forecast period.
