Report Overview

Mechanical control suspension system is a mechanical device used for vehicle suspension control, which adjusts and controls the suspension through mechanical structure and transmission system. This suspension system typically consists of the following main components: 1. Suspension spring: Suspension spring is one of the basic components of a mechanically controlled suspension system, responsible for supporting and buffering the weight and vibration of the vehicle. Common suspension springs include coil springs and torsion bar springs. 2. Damper: The damper is used to control the motion speed and shock absorption effect of the suspension, and it reduces the vibration and impact of the suspension by generating damping force. Common types of dampers include hydraulic dampers and pneumatic dampers. 3. Control rod: The control rod is a mechanical rod connecting various components of the suspension, which changes the geometric shape and motion characteristics of the suspension by adjusting the length and angle of the rod. The design and adjustment of the control lever can affect the stiffness, stroke, and shock absorption effect of the suspension. 4. Connecting rod: The connecting rod is a mechanical connection used to transmit force and motion, connecting various components of the suspension, such as suspension springs, dampers, and the vehicle body. The length and angle of the connecting rod can affect the dynamic characteristics of the suspension and the handling performance of the vehicle. 5. Adjustment device: Mechanical control suspension systems are usually equipped with adjustment devices to adjust the stiffness, stroke, and shock absorption effect of the suspension. The adjustment device can be manually operated or automatically adjusted according to different needs and driving conditions. The mechanical control suspension system can adjust the height, stiffness, and shock absorption effect of the vehicle suspension through the coordination of the above

components, thereby providing better suspension performance and driving comfort. It is usually applied to special vehicles that require precise adjustment and control of suspension, such as racing cars, off-road vehicles, and engineering vehicles.

The global Mechanical Control Suspension System market size was estimated at USD 4850.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
