Abstracts

The mechanical decanter is one of the key equipment in sewage treatment processes such as SBR (intermittent activated sludge process). The mechanical decanter is a device that realizes the drainage function through a mechanical structure. It usually has a sturdy bracket and drive device, which can withstand various stresses during work. In the SBR process, the mechanical decanter is designed to remove clarified water from the static pool surface without stirring the sediment, thereby ensuring the effluent water quality. The structure of the mechanical decanter is relatively complex, usually including an adjustable weir and an associated mechanical transmission system. The weir is used to control the height and drainage speed of the drain port, while the mechanical transmission system is used to drive the up and down movement of the weir. In addition, the mechanical decanter may also be equipped with an automatic control device to achieve precise control of the decanting process.

The global Mechanical Decanter market size was estimated at USD 902.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.70% during the forecast period.
