Abstracts

Mechanical recycled plastic is a process that transforms waste plastics into reusable materials through physical processing, applicable to various types such as PE, PP, and PVC. Key steps include crushing, washing, screening, and pelletizing. Crushing breaks plastics into granules or flakes, washing removes contaminants, screening sorts particles by size, and pelletizing forms standard pellets via extrusion. This method is low-cost and simple but results in recycled plastics whose quality depends on feedstock purity. For example, recycled PET bottles can be made into food packaging or textiles, while PP plastics are often used for injection-molded parts. For mixed or heavily contaminated plastics, mechanical recycling is less efficient and requires chemical recycling. Applications span packaging, construction, and automotive sectors, such as recycled LDPE for plastic bags and ABS pellets for appliance housings. Mechanical recycling is a foundational step in the plastic circular economy, promoting resource reuse and carbon reduction.

The global Mechanical Recycled Plastic market size was estimated at USD 7478.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.40% during the forecast period.
