Abstracts

Mechanism design optimization refers to a comprehensive design strategy that systematically improves the structural form, motion characteristics, parameter configuration, and material selection of mechanical mechanisms through mathematical modeling, simulation analysis, and algorithm optimization. This approach aims to achieve lightweight, high stiffness, high efficiency, and high reliability while meeting functional requirements. By combining multi-objective optimization (such as strength, energy consumption, cost, and space constraints) with intelligent algorithms (such as genetic algorithms, topology optimization, and simulation-driven design), mechanism design optimization can significantly improve product performance and manufacturing economics, and is widely used in robotics, automotive, aerospace, construction machinery, and intelligent equipment.

The global Mechanism Design Optimization Scheme market size was estimated at USD 2471.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.00% during the forecast period.
