Abstracts

Meclizine hydrochloride is an antihistamine medication primarily used to prevent and treat nausea, vomiting, and dizziness associated with motion sickness, as well as vertigo caused by inner ear problems. It functions by blocking histamine H1 receptors in the brain, reducing stimulation of the vestibular system and diminishing signals that trigger nausea and balance disturbances. Available in both prescription and over-the-counter formulations under various brand names such as Bonine and Dramamine Less Drowsy, it is distinguished by its longer duration of action and comparatively milder sedative effects relative to other antihistamines like dimenhydrinate. The drug is commonly administered in tablet or chewable form and is considered a first-line option for motion sickness prevention due to its efficacy, accessibility, and favorable side effect profile.

The global Meclizine Hydrochloride market size was estimated at USD 35.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
