## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Media for Vitrification and Thawing competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Media for Vitrification and Thawing includes vitrification media, thawing media and warming media. Vitrification Media is a liquid used to freeze and preserve biological samples. Its main feature is that it can form a solid structure similar to the glass state at extremely low temperatures, thereby preventing the movement of active molecules in biological samples and allowing the samples to remain intact for a long time. Vitrification thawing technology is a process that reverses vitrification freezing. By using protective agent solutions with gradually decreasing concentrations, the cryoprotectant that enters the cells during the freezing process is replaced with water, and there is no damage to ice crystals during the thawing and replacement process.

The global Media for Vitrification and Thawing market size was estimated at USD 112.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.90% during the forecast period.
