Abstracts

Medical dry electrodes are a class of biomedical sensors used for measuring biopotential signals?such as electroencephalography (EEG), electrocardiography (ECG), and electromyography (EMG)?without the need for conductive gels, adhesives, or skin preparation, relying instead on direct capacitive or resistive contact with the skin. These electrodes are typically fabricated from conductive materials like metals, conductive polymers, or nanomaterials, often structured with micro-needles, springs, or flexible substrates to enhance signal quality, comfort, and long-term wearability. They are designed to overcome limitations of traditional wet electrodes, such as signal degradation over time, skin irritation, and the inconvenience of application, making them particularly suitable for continuous health monitoring, ambulatory diagnostics, wearable medical devices, and emerging applications in brain-computer interfaces and consumer health technology.

The global Medical Dry Electrodes market size was estimated at USD 617.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 9.25% during the forecast period.
