Report Overview:

Electromagnetic tracking, also referred magnetic tracking, employs sensors at the joints that record their movements by returning their locations and orientations to a central processor. Electromagnetic Tracking Systems (EMTSs) use electromagnetic field producers to detect the pose of electromagnetic sensors. EMTSs does not require a direct line-of-sight, however, the presence of metal or ferromagnetic sources in the operating workspace can affect the measurement accuracy. Electromagnetic (EM) tracking allows medical professionals to understand the position and orientation of medical devices, to a sub-millimeter level of accuracy. Another benefit of EM tracking is that it can track in and around people, walls, and even tools– no line-of-sight between the EM tracking components is required. This gives doctors the ability to track where devices are in 3D space and angular orientation, providing an added level of situational awareness.

The Global Medical Electromagnetic Tracking System Market Size was estimated at USD 1038.71 million in 2023 and is projected to reach USD 1963.92 million by 2029, exhibiting a CAGR of 11.20% during the forecast period.
