Abstracts

Medical Evacuated Drainage Bottle is a sterile medical device designed for collecting and draining bodily fluids, such as blood, pus, or other exudates, from a patient during surgical procedures or post-operative care. The bottle is typically made of high-quality, durable plastic or glass, and it is equipped with an airtight seal to create a vacuum, which helps to evacuate fluids effectively. The evacuated drainage bottle works by utilizing negative pressure to draw fluids from a wound or surgical site into the container, helping to prevent the accumulation of excess fluid in the body that could lead to complications such as infection or delayed healing. The bottle is fitted with one or more drainage tubes, which are inserted into the patient's body, typically through a surgical wound or incision. Once the tube is placed, the bottle is positioned at a lower level to facilitate fluid collection through gravity and vacuum action. These bottles are often used in conjunction with a one-way valve system to ensure that the fluids flow into the bottle without backflow.

The global Medical Evacuated Drainage Bottle market size was estimated at USD 719.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.70% during the forecast period.
