Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Medical Hydrophilic Lubricious Coating competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Medical Hydrophilic Lubricious Coating production reached approximately 392 tons, with an average global market price of around US\$ 462 per kilogram. In 2024, the global 's total production capacity of Medical Hydrophilic Lubricious Coating reached 510 tons. The industry average gross profit margin of this product reached 28%. Medical hydrophilic lubricating coatings are specialized functional coatings applied to the surfaces of medical devices. The water-swelling polymer coating forms a soft, smooth hydrogel layer between the device surface and human tissue. This layer acts like a "water cushion," transforming direct dry friction into fluid lubrication, significantly reducing frictional resistance. The hydrophilic coating tightly binds to water molecules through hydrogen bonds, forming a hydrated surface. This surface has very low surface energy, similar to the lotus effect, making it difficult for proteins, cells, and other biomolecules to adhere, thereby reducing resistance during insertion. The upstream segment of the medical hydrophilic coating industry chain forms the foundation of coating formulations, primarily including coating materials. These materials primarily utilize biocompatible polymers such as polyvinylpyrrolidone (PVP), polyurethane, and polyacrylic acid (PAA). These materials are formed using technologies such as UV curing or thermal curing. Fluctuations in the performance and price of upstream materials directly impact the quality, cost, and production capacity of midstream coating products. The midstream segment of the industry chain encompasses coating production, manufacturing, and R&D, a sector characterized by global competition. Midstream companies offer products ranging from single-layer coatings to dual-layer coating systems combining a base adhesive layer with a top

hydrophilic lubricating layer. The downstream segment of the industry chain encompasses the application areas of coating products, directly addressing end-use medical needs. Hydrophilic lubricating coatings are primarily used in interventional medical devices such as catheters (especially central venous catheters and peripherally inserted central venous catheters), guidewires, and stent delivery systems. Catheters are the largest application area. Growth in demand from medical institutions that ultimately utilize these coated devices is driven by factors such as the increasing prevalence of minimally invasive surgery, an aging population, and rising prevalence of chronic diseases.

The global Medical Hydrophilic Lubricious Coating market size was estimated at USD 181.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
