Report Overview

Superconducting magnet is an electromagnet made from coils of superconducting wire. They must be cooled to cryogenic temperatures during operation. In its superconducting state the wire has no electrical resistance and therefore can conduct much larger electric currents than ordinary wire, creating intense magnetic fields. Superconducting magnets can produce greater magnetic fields than all but the strongest non-superconducting electromagnets and can be cheaper to operate because no energy is dissipated as heat in the windings. Superconducting magnets are widely used in medical imaging applications, particularly in magnetic resonance imaging (MRI) machines. MRI is a non-invasive diagnostic technique that uses strong magnetic fields and radio waves to produce detailed images of the internal structures of the body.
