Report Overview

An isolation amplifier is a type of amplifier that helps measure the small signals present in a high common-mode voltage. They are used in several industries to reduce the risk of shock. It is designed with a high voltage current flow that will potentially reduce the risk for the users. The different types of protection provided by the Isolation Amplifier are grounding, insulation of lethal voltages and isolation. The high voltage could be dangerous for humans; therefore, enabling the isolation amplifier would be useful. It can also act as a safety barrier against the problems. The medical industry uses this to secure the patients from getting troubled by any power leak. For measuring different human body tissues, the isolation amplifier is also used.
