Abstracts

Medical polymer microspheres refer to polymer materials or polymer composite materials with a diameter ranging from nanometer to micrometer and a spherical or other geometric shape. These microspheres have broad application prospects in the medical field, such as drug preparation, delivery, analysis and detection, etc. Specifically, the drugs in medical polymer microspheres can be dissolved or dispersed in the ball-forming material to form skeleton-type micro-spherical or spherical-like particles. These microspheres have excellent properties such as fluidity, biocompatibility, functional group properties, surface effect, and volume effect, and thus can play an important role in the medical field. In the field of biomedicine, microspheres have shown great potential in drug preparation, delivery, analysis and detection. In the future, with in-depth research and development on the functions of microspheres, their applications will be further expanded to cutting-edge fields such as gene therapy, tissue engineering, and biosensors.

The global Medical Polymeric Microspheres market size was estimated at USD 138.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
