Abstracts

Medical single-use scissors are sterile, disposable cutting instruments designed for one-time use in healthcare settings, primarily during surgical procedures, wound care, dressing changes, and other clinical applications where aseptic technique and infection prevention are critical. These scissors are manufactured from materials such as stainless steel or high-grade plastics, often featuring specialized tips (e.g., blunt, sharp, or curved) tailored to specific medical tasks, and are packaged individually to maintain sterility until the moment of use. Their single-use nature eliminates the need for reprocessing, reducing the risk of cross-contamination, saving time and resources associated with sterilization, and ensuring consistent performance and sharpness for each procedure.

The global Medical Single Use Scissors market size was estimated at USD 176.8 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.75% during the forecast period.
