Report Overview

A medical thermopile sensor is a type of sensor used in medical and healthcare settings to measure temperature. It utilizes the thermoelectric effect, which is the conversion of temperature differences into electrical voltage. A thermopile sensor consists of multiple thermocouples connected in series or parallel. Each thermocouple is comprised of two dissimilar materials that generate a voltage across their junctions when exposed to a temperature gradient. The total voltage output of the thermopile is then proportional to the temperature difference between the hot and cold junctions.
