Report Overview:

Thromboelastography (TEG) is a viscoelastic hemostatic assay that measures the viscoelastic properties of blood clot formation. It is mainly used in surgery and anesthesiology. This test is capable of measuring coagulation factor function. Some of the other tests for blood coagulation includes prothrombin time and partial thromboplastin time (aPTT). However, thromboelastography provides information regarding all components of hemostasis such as coagulation and platelet function. Also, TEG offers a particular advantage in diagnosing fibrinolysis. TEG machines are used for carrying out this test.
