### Report Overview:

Root canal treatment (endodontics) is a dental procedure used to treat infection at the centre of a tooth. Root canal treatment is not painful and can save a tooth that might otherwise have to be removed completely. Root canal treatments all aim to remove infected or inflamed material from inside the tooth. The variations in types of this therapy depend on the tools the endodontist uses to clean out the root canals of the tooth. Some use physical equipment, while other treatments include using lasers, water, and/or sound. The exact tools the doctor uses will depend on your tooth health and the anatomy of your root canals. Generally, the procedure starts with the endodontist preparing the area and numbing it with a local anesthetic. Next, they will open the tooth to clean out the interior using the tools of their choice. Lastly, they seal the root canals with a filling material before you get your crown or other restoration from your dentist.
