Report Overview

Medical and surgical instruments in a variety of sizes and complexity can pose challenges when it comes to cleaning, disinfecting and sterilizing them after use. An ultrasonic cleaner is an ideal tool for the first step in this three step process to protect medical personnel and patients from possible infection due to pathogens that remain on the instruments after a procedure. Ultrasonic cleaners work on the principle of cavitation whereby ultrasonic transducers create billions of minute air bubbles in an ultrasonic cleaning solution. These implode with violent force when they come in contact with objects placed in the solution and strip away contaminants without damaging the objects. When medical and surgical instruments are properly prepared for the ultrasonic cleaning step the process is fast, thorough and efficient.
