Report Overview

Medical vein illumination device is a handheld or portable device used by healthcare professionals, such as nurses, phlebotomists, and doctors, to aid in locating and visualizing veins in patients. It is particularly useful when performing procedures that require venous access, such as blood draws, intravenous (IV) insertions, and other medical interventions. The device works by using various technologies to enhance the visibility of veins beneath the skin, making it easier for medical professionals to identify suitable veins for medical procedures. Vein illumination devices are especially helpful in situations where veins are difficult to locate, such as in patients with difficult-to-palpate veins, dark skin tones, obesity, or pediatric patients.

The global Medical Vein Illumination Device market size was estimated at USD 165.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
