Abstracts

Medical viable bone matrix (VBM) refers to a category of allogeneic bone graft products derived from human donor bone tissue that retains the natural osteogenic, osteoinductive, and osteoconductive properties necessary for bone regeneration and healing. These products are processed to remove cellular and antigenic components while preserving the structural integrity, growth factors, and collagen matrix that facilitate new bone formation. VBM is used in orthopedic, spinal, dental, and craniofacial surgeries to fill bone defects, support spinal fusions, and augment skeletal reconstruction, offering a biologic alternative to autografts or synthetic bone substitutes.

The global Medical Viable Bone Matrix market size was estimated at USD 520.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
