Abstracts

Medical wet electrodes are specialized biomedical sensors used for recording physiological signals, particularly in electrocardiography (ECG), electroencephalography (EEG), and electromyography (EMG) applications; these electrodes consist of a conductive element, typically silver/silver chloride (Ag/AgCl), coupled with a hydrogel or saline-based electrolyte layer that hydrates the skin to reduce impedance and enhance signal quality by ensuring stable electrical contact between the skin surface and monitoring equipment. The "wet" designation refers to the presence of this electrolytic medium, which distinguishes them from dry electrodes that operate without added moisture, and they are designed for single-use or short-term monitoring to maintain hygiene, prevent infection, and ensure consistent performance in clinical and diagnostic settings.

The global Medical Wet Electrodes market size was estimated at USD 730.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.15% during the forecast period.
