Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Medium Frequency Furnace Lining Material competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Medium frequency furnace lining is a refractory material used on the inner wall of a medium-frequency induction furnace. It isolates the molten metal from the furnace induction coil and withstands high temperatures and corrosion. Upstream mainly involves raw material supply, including various refractory raw materials (such as alumina, silica, and magnesia), binders, and additives. The quality and stability of these materials directly determine the refractoriness, thermal stability, and corrosion resistance of the furnace lining. Global sales in 2024 were approximately 3 million tons, with an average market price of approximately US\$370 per ton. The scale of single-line production capacity varies depending on the production process and investment scale of the production equipment, with industry gross profit ranging from 12% to 30%.

The global Medium Frequency Furnace Lining Material market size was estimated at USD 1050.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.90% during the forecast period.
