## Abstracts

A medium frequency system refers to a specialized electrical power conversion system operating within the 300 Hz to 3 kHz frequency range, designed for industrial and scientific applications requiring precise heating, melting, or material processing capabilities. These systems typically consist of a power supply unit, induction coils, and control mechanisms that convert standard 50/60 Hz grid power into medium-frequency alternating current, enabling efficient and controlled electromagnetic induction for processes such as metal hardening, brazing, annealing, and semiconductor crystal growth. The operational principle relies on generating eddy currents within conductive materials, producing localized and rapid heating without direct contact, making these systems essential in manufacturing sectors where thermal precision, energy efficiency, and process repeatability are critical.

The global Medium Frequency System market size was estimated at USD 345.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
