### Report Overview

Fiber Laser refers to a laser that uses rare earth-doped glass fiber as the gain medium. Fiber lasers can be developed on the basis of fiber amplifiers. High power density is easily formed in the fiber under the action of pump light, resulting in laser. The laser energy level of the working substance is 'population inversion', and when a positive feedback loop (to form a resonant cavity) is properly added, the laser oscillation output can be formed. There are many types of fiber lasers, which are divided into crystal fiber lasers, nonlinear optical fiber lasers, rare-earth doped fiber lasers, and plastic fiber lasers according to fiber materials or gain media; according to the resonant cavity structure, they are divided into FP cavity, ring cavity, Loop reflector fiber resonator and '8' shape cavity, DBR fiber laser, DFB fiber laser, etc.; according to the fiber structure, it is divided into single-clad fiber laser, double-clad fiber laser, photonic crystal fiber laser, and special fiber laser; The output laser characteristics are divided into continuous fiber lasers and pulsed fiber lasers.
