Abstracts

Medium power film capacitors are passive electronic components that utilize a thin plastic film as the dielectric material, designed to operate in a voltage range typically between 250V and 2kV, with capacitance values spanning from approximately 0.1 μ F to 100 μ F. These capacitors are characterized by their stability, low losses, high insulation resistance, and self-healing properties, making them suitable for applications requiring reliable performance in AC and pulse conditions, such as motor run circuits, power factor correction, snubber circuits, lighting ballasts, renewable energy systems, and industrial power supplies. They are constructed with metallized or foil electrodes and are available in various configurations, including radial, axial, and box styles, often encapsulated or encased for environmental protection and enhanced safety. The dielectric films commonly used include polypropylene (PP), polyester (PET), polycarbonate (PC), and polyphenylene sulfide (PPS), each offering distinct advantages in terms of temperature stability, frequency response, and cost-effectiveness, allowing manufacturers to tailor products to specific operational requirements and industry standards.

The global Medium Power Film Capacitors market size was estimated at USD 920.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
