Report Overview

Ceramic cores are traditionally manufactured using a medium pressure injection moulding process. The material mixing element of the ceramic core manufacturing process typically includes the blending of fused silica and other refractory materials that is blended with a binder material. This mixture of fused silica, refractory materials and binders is then heated and injected under pressure into a metal mould. After injection moulding the ceramic core is then fired at high temperature to complete the removal of the binder material and to optimise the final core strength properties.
