Report Overview:

Ceramic cores are traditionally manufactured using a medium pressure injection moulding process. The material mixing element of the ceramic core manufacturing process typically includes the blending of fused silica and other refractory materials that is blended with a binder material. This mixture of fused silica, refractory materials and binders is then heated and injected under pressure into a metal mould. After injection moulding the ceramic core is then fired at high temperature to complete the removal of the binder material and to optimise the final core strength properties.

The Global Medium Pressure Injection Moulding Ceramic Core Market Size was estimated at USD 134.28 million in 2023 and is projected to reach USD 207.23 million by 2029, exhibiting a CAGR of 7.50% during the forecast period.
