Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Medium Voltage Shore Power Shipboard Device (AMP) competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The medium voltage shore power onboard device (AMP) refers to the equipment on board the ship for receiving and converting shore-based power. When the ship is at port, it transfers power from the ship's generator to the power provided by the port power grid through the shore-based device; when the ship leaves the port, the power used by the ship's equipment is transferred back to the ship's generator system from the port power grid. This device can effectively achieve energy saving, emission reduction and noise reduction, and complies with domestic and foreign classification society regulations and shore power IEC standards.

The global Medium Voltage Shore Power Shipboard Device (AMP) market size was estimated at USD 1945.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.70% during the forecast period.
