## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Medium Wave Infrared Simulator competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A mid-wave infrared simulator is a device used to simulate mid-wave infrared radiation environments, primarily for testing, calibrating, and researching the performance of mid-wave infrared imaging equipment or sensors. By emitting infrared light in specific wavebands, it simulates infrared radiation conditions similar to those in real-world environments, allowing various infrared detectors, imagers, and other devices to undergo precise performance evaluation and debugging under controlled conditions. Mid-wave infrared simulators are widely used in aerospace, military, and scientific research fields, playing a crucial role in the development and verification of infrared technology. The mid-wave infrared simulator industry chain mainly includes upstream suppliers of core components such as infrared detectors, optical lenses, and blackbody/infrared light sources; midstream system integration and equipment manufacturing (including the integration of opto-mechanical systems, infrared radiation sources, and control and driving software); and downstream application fields such as military, security, scientific research, and industrial inspection. Due to the complex technology, high degree of customization, and small order quantities, midstream manufacturing companies belong to a high-value-added industry, with overall gross profit margins typically ranging from 30% to 50%. Capacity utilization is significantly affected by order fluctuations, generally ranging from 50% to 70%, with a few companies stably supplying military or research institutions reaching 70% to 85%. In 2024, the global production of mid-wave infrared simulators reached 32,871 units, with an average selling price of US\$70,000 per unit. Medium-wave infrared simulators play a vital role in infrared technology testing and verification, especially in the fields of

aerospace, military and scientific research. With the continuous development of infrared detection technology, the requirements for accuracy and reliability of equipment are getting higher and higher. Medium-wave infrared simulators provide a controllable and highly repeatable test platform by simulating infrared radiation in real environments, effectively reducing the cost and risk of field testing. It not only accelerates the research and development process of infrared equipment, but also improves the performance and stability of products. It is a key tool to promote the innovation and application of infrared technology.

The global Medium Wave Infrared Simulator market size was estimated at USD 2301.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.30% during the forecast period.
