Abstracts

Melt blown filtration media is a nonwoven fabric produced through a specialized extrusion process where polymer granules are melted, extruded through fine spinnerets, and drawn by high-velocity hot air to form micro- or nanoscale fibers, which are then collected on a conveyor to create a randomly oriented web with high surface area, porosity, and filtration efficiency. This material is engineered to capture particles, aerosols, and microorganisms through mechanisms such as inertial impaction, interception, diffusion, and electrostatic attraction, making it a critical component in applications ranging from face masks and respirators to HVAC filters, automotive cabin air filters, and medical and industrial air and liquid filtration systems. Its performance is characterized by metrics such as filtration efficiency, pressure drop, and quality factor, with key material inputs including polypropylene (most common), but also other polymers like polyester or polycarbonate, depending on required properties such as chemical resistance or thermal stability.

The global Melt Blown Filtration Media market size was estimated at USD 1200.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
