## Abstracts

Melt transesterification polycarbonate is a process for producing polycarbonate using melt transesterification reaction technology. By allowing diphenol to undergo transesterification reaction with carbonic acid diester or carbonic acid diester derivative under solvent-free conditions at high temperature, polycarbonate products with excellent transparency, impact resistance and thermal stability are synthesized. This process has been widely used in the manufacture of high-end optical materials, electronic components, automotive parts and household products due to its mild reaction conditions, stable product quality and high production efficiency.

The global Melt Transesterification Process Polycarbonate market size was estimated at USD 8071.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.70% during the forecast period.
