Abstracts

Membrane Based WFI Production System uses advanced filtration processes, primarily reverse osmosis (RO) and ultrafiltration (UF), to produce high-purity water suitable for pharmaceutical use. In this method, water is filtered through semi-permeable membranes that remove contaminants, bacteria, and endotoxins without the need for traditional distillation. The membrane-based approach is energy-efficient, operates at lower temperatures, and reduces maintenance costs compared to distillation-based WFI systems. By maintaining a high level of purity and meeting stringent regulatory standards, membrane-based WFI systems are increasingly favored for producing sterile, injectable-grade water in the pharmaceutical industry.
