Report Overview

Membrane Bioreactor (MBR) is generally a term used to define wastewater treatment processes where a perm-selective membrane, eg microfiltration or ultrafiltration, is integrated with a biological process ? specifically a suspended growth bioreactor. Membrane Bioreactor (MBR) is a relatively new yet fast maturing technology in the area of wastewater treatment. Prevalent technologies in wastewater treatment such as a conventional activated sludge (CAS) system are gradually replaced by MBR. Almost all commercial MBR processes available today use the membrane as a filter, rejecting the solid materials which are developed by the biological process, resulting in a clarified and disinfected product effluent. MBR's are generally employed for larger scale water purification systems. Primarily such systems are utilized by commercial and industrial sectors or by municipalities. With growing population and increasing requirements for sufficient clean and fresh water, treatment of wastewater is imperative. Of all the MBR's employed globally, a majority belongs to municipal corporations for treatment of domestic wastewater. MBR's are classified as submerged/immersed MBR's where membranes are submerged in the aeration tank itself and external/side stream MBR's. In side stream MBR's, mixed wastewater is pumped from the aeration tank to the membrane.

Major players in the global membrane bioreactor (MBR) include SUEZ, Evoqua, Asahi Kasei, KUBOTA and Koch. In 2020, the world's top five manufacturers accounted for about 50.37%. In terms of type, hollow fiber membranes account for about 75.8% of total sales in 2020.
