Abstracts

The membrane electrode coater is a battery production equipment based on coating technology, which is mainly used in the field of fuel cells. The following is a brief summary of the membrane electrode coater: First, the main function of the membrane electrode coater is to coat the positive and negative electrode materials of the battery (usually catalyst slurry) through the electrode coating head on the coating machine to form the positive and negative electrode sheets of the battery. In fuel cells, this usually refers to evenly coating the catalyst on the gas diffusion layer of the proton exchange membrane to form the catalyst layer of the membrane electrode. This layer is the place where the electrochemical reaction of the fuel cell occurs, which is crucial to the performance and life of the battery. Secondly, the membrane electrode coater is characterized by high efficiency, precision and intelligence, which can achieve uniform coating of electrode materials and improve the performance and stability of the battery. It is widely used in new energy vehicles, energy storage equipment, aerospace and other fields, and is one of the key equipment in the manufacturing process of fuel cells. With the rapid development of the new energy industry, membrane electrode coaters are also constantly updated to meet the production needs of higher performance, lower cost and more environmental protection.

The global Membrane Electrode Coating Machine market size was estimated at USD 147.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 16.60% during the forecast period.
