Abstracts

A membrane heart-lung machine, also known as a cardiopulmonary bypass (CPB) machine, is a vital medical device used during open-heart surgery to temporarily take over the functions of the heart and lungs. It uses a membrane oxygenator, which is a specialized filter that oxygenates blood by exchanging oxygen and carbon dioxide, much like the lungs do. This process allows the blood to be oxygenated and circulated through the body, ensuring that tissues and organs continue to receive oxygen while the heart is temporarily stopped for surgical procedures.

The global Membrane Heart-Lung Machine market size was estimated at USD 727.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.70% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Membrane Heart-Lung Machine market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
