Abstracts

Film heating elements are a type of heating element made of nano-electric heating materials or specific resistance materials. They form a thin film resistance heating layer by coating or printing the heating material on the substrate. When the resistance layer is energized, it will quickly generate heat and transfer the heat to the heated object through the substrate. This type of heating element has the advantages of small size, light weight, uniform heating, and fast response speed, and has been widely used in many fields.

The global Membrane Heating Element market size was estimated at USD 569.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 15.00% during the forecast period.
