## Abstracts

Membrane Separation Ammonia Cracker is a hydrogen generation technology that combines ammonia thermal decomposition with membrane-based selective hydrogen separation. During operation, ammonia is catalytically cracked into hydrogen and nitrogen at high temperatures (typically 500-800°C). A hydrogen-selective membrane—often made from palladium alloys, ceramics, or advanced composites—is integrated into the reactor to continuously extract hydrogen as it forms. This shifts the reaction equilibrium, improves conversion efficiency, and enables production of ultra-high purity hydrogen (>99.99%) in a compact system.

The global Membrane Separation Ammonia Cracker market size was estimated at USD 215.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 20.50% during the forecast period.
