Report Overview

The development trend of in-vehicle chips (CPU-GPU-FPGA-ASIC) In the past, automotive electronic chips were dominated by electronic control units (ECU) corresponding to sensors one-to-one, mainly distributed on core components such as engines. With more and more automotive sensors, the traditional distributed architecture is gradually lagging behind and gradually replaced by centralized architecture DCU and MDC. At present, the penetration rate of assisted driving functions is getting higher and higher. The realization of these functions requires the help of new sensor data such as cameras and radars. Traditional CPUs have insufficient computing power. In this regard, powerful GPUs replace CPUs. Coupled with the training process required by assisted driving algorithms, GPU+FPGA has become the current mainstream solution.
