## Abstracts

A Memory Wafer Tester is a specialized piece of equipment used in the semiconductor industry to test memory chips (such as DRAM) that are still in the form of wafers. A wafer is a thin slice of semiconductor material, like silicon, on which the memory chips are fabricated. It checks the electrical characteristics of each memory cell and verifies its ability to store and retrieve data correctly. This ensures that the memory chips meet performance specifications. It identifies defective memory cells on the wafer. These defects could be due to issues like manufacturing irregularities, contamination, or variations in material quality. By identifying defective areas early in the manufacturing process, manufacturers can remove or repair those areas before moving on to more expensive packaging and final testing steps, improving overall yield. It measures different parameters like voltage, current, timing, and power consumption of the memory cells to ensure they meet the required standards. Memory wafer testers are critical in modern semiconductor fabrication, ensuring the quality and reliability of memory devices used in everything from consumer electronics to high-end computing systems.

The global Memory Wafer Tester market size was estimated at USD 617.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.40% during the forecast period.
