Abstracts

MEMS absorptive RF switches are semiconductor devices that integrate micro-electromechanical systems (MEMS) technology with radio frequency (RF) signal routing, designed to selectively connect or isolate RF paths while providing high isolation and minimal signal reflection in the "off" state by terminating unused ports into matched loads. These components are critical in applications requiring precise signal control, such as in wireless communication systems, test and measurement equipment, radar, and aerospace, where they offer advantages over traditional solid-state switches?including lower power consumption, superior linearity, higher power handling, and enhanced reliability?due to their mechanical switching mechanism and absorptive nature that prevents signal bounce and improves system performance.

The global Mems Absorptive Rf Switch market size was estimated at USD 245.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.45% during the forecast period.
