Report Overview

MEMS-based LiDAR (Micro-Electro-Mechanical Systems Light Detection and Ranging) is an advanced sensing technology that utilizes micro-mirrors or other MEMS components to steer laser beams for high-resolution 3D mapping and object detection. Unlike traditional mechanical LiDAR systems, which rely on bulky rotating components, MEMS-based LiDAR offers a compact, scalable, and cost-effective solution by leveraging semiconductor fabrication techniques. These systems are capable of rapid beam steering with low power consumption, making them particularly suitable for applications in autonomous vehicles, robotics, industrial automation, and smart infrastructure. The technology enables precise depth perception and real-time environmental modeling by emitting laser pulses and measuring their time of flight, with MEMS mirrors dynamically adjusting the beam direction to cover a wide field of view. As a result, MEMS-based LiDAR addresses key challenges in size, reliability, and affordability, positioning it as a disruptive alternative in the rapidly evolving LiDAR market.

The global Mems Based Lidar market size was estimated at USD 374.91 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 0.15% during the forecast period.
