Abstracts

Mems electronic oscillators are solid-state timing devices that utilize micro-electromechanical systems (MEMS) technology, where a microscale mechanical resonator—often made of silicon—vibrates at a precise frequency to generate a stable clock signal, replacing traditional quartz crystal oscillators in electronic circuits. They are characterized by their small form factor, high shock and vibration resistance, low power consumption, and suitability for integration with complementary metal-oxide-semiconductor (CMOS) processes, making them ideal for applications in consumer electronics, telecommunications, automotive systems, and IoT devices where miniaturization, reliability, and performance under harsh conditions are critical.

The global Mems Electronic Oscillators market size was estimated at USD 550.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
